Exercise 1

The project on GitHub

At the end, `PlatformerLab` is a Unity project in a private GitHub repository, and you know the four Git commands that end every exercise.

Before you start

- Unity Hub, signed in, with **Unity 6.6** (`6000.6.x`) installed
- Git: git-scm.com on Windows (default options), `xcode-select --install` on macOS; check with `git --version`
- A GitHub account: github.com

1 Configure Git

ONCE PER COMPUTER

```
git config --global user.name "First Last"
git config --global user.email "you@example.com"
git config --global pull.rebase true
```

- Use the email address of your GitHub account
- On a lab computer, run the first two commands at the start of every seminar

2 Create the Unity project

- Already created it with the setup guide? Skip to section 3
- Unity Hub: **Projects** › **New project**
- Editor Version: `6000.6.x`
- Template: **Universal 2D**
- Project name: `PlatformerLab`
- Location: a local folder such as `D:\Unity` (no diacritics, no spaces, not in OneDrive)
- **Connect to Unity Cloud** and **Use Unity Version Control**: unchecked
- **Create project**

3 Create the GitHub repository

- github.com: **New repository**
- Repository name: `PlatformerLab`
- Visibility: **Private**
- .gitignore: **Unity** (no README, no license)
- **Create repository**, then copy its HTTPS URL from the **Code** button

4 Connect the project to the repository

- Project created with the setup guide? Delete its `.gitignore` first: `del .gitignore`

In a terminal, in the project folder (the one that contains `Assets`):

```
cd D:/Unity/PlatformerLab
git init -b main
git remote add origin https://github.com/YOUR-USERNAME/PlatformerLab.git
git pull origin main
git status
git add .
git commit -m "Create Unity project"
git push -u origin main
```

- `git pull` asks you to sign in to GitHub: choose **Sign in with your browser** (macOS: use a personal access token as the password)
- `git status` must not list `Library/`; if it does, stop and ask for help
- Warnings about LF/CRLF line endings are harmless
- Refresh the repository page: `Assets`, `Packages` and `ProjectSettings` are there

5 Every exercise from now on

```
git pull                          # when you start a session
git add .                         # after Ctrl+S in Unity
git commit -m "What you changed"
git push                          # at the end of every exercise
```

- Every exercise ends with `Ctrl` + `S` in Unity and the last three lines, with the commit message it gives
- Push rejected? `git pull`, then `git push` again
