Exercise 7

No sticking to walls

At the end, the walker slides down walls instead of hanging on them in mid-air.

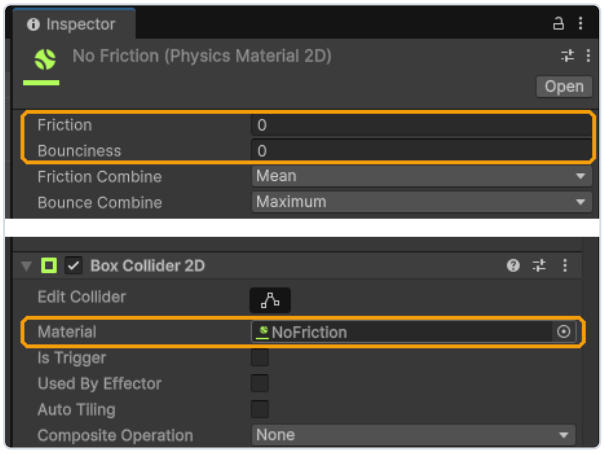

Before you start

- Exercise 6 done and pushed: the walker falls off the ledge. In a new session, run `git pull` first

1 Wall-stick, then no friction

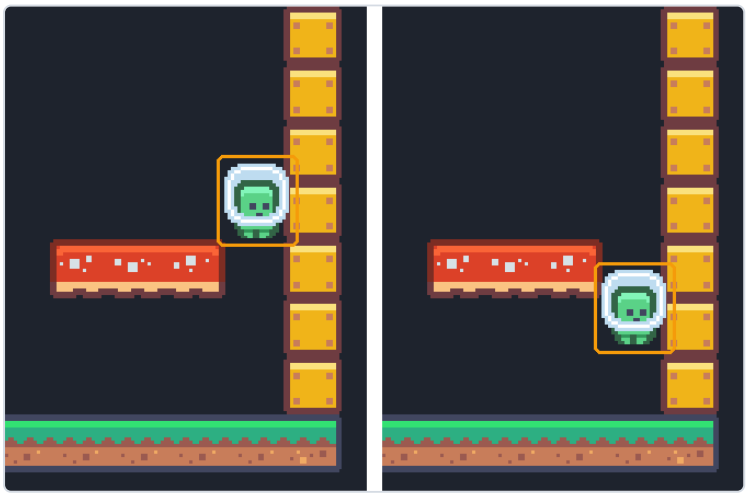

A walker pushed against a wall in the air hangs there, because friction between the two colliders holds it up. A physics material with zero friction removes the problem.

- **Play** and hold `D`: the walker walks off the right end and hangs on the wall for as long as you hold the key. Stop.
- In the Project window, create the folder `Assets/Physics`; inside it, right-click, **Create** › **2D** › **Physics Material 2D**, and name it `NoFriction`.
- In its Inspector, set Friction to `0`. Bounciness is already `0`, and the two Combine settings stay as they are.
- Select `Walker` and drag `NoFriction` into **Box Collider 2D, Material**. The Sprite Renderer's Material is a different thing, used for drawing.

Friction 0 on the material, and the material in the walker's collider.

- **Play** and hold `D` again: the walker now slides down the wall at full fall speed. Stop.

Holding `D` against the wall: stuck without NoFriction (left), sliding with it (right).

- `Ctrl` + `S`, then commit and push with the message `Add NoFriction against wall-stick`.
