Exercise 10

A tap for a short hop

At the end, a tap of `Space` gives a short hop and a held `Space` the full jump.

Before you start

- Exercise 9 done and pushed: `Space` jumps 3.5 units. In a new session, run `git pull` first

1 Run 5: a tap for a short hop

Releasing `Space` while rising halves the upward speed, so a tap gives a hop and a hold the full height. The release is caught like the press.

Below `jumpRequested`, add:

```
    private bool jumpCutRequested;
```

In `Update`, after the press check, add:

```
        if (jumpAction.WasReleasedThisFrame())
        {
            jumpCutRequested = true;
        }
```

In `FixedUpdate`, between the jump and the clear, add the cut, and clear the new flag too:

```
        if (jumpCutRequested && rb.linearVelocity.y > 0f)
        {
            rb.linearVelocity = new Vector2(rb.linearVelocity.x, rb.linearVelocity.y * 0.5f);
        }

        jumpRequested = false;
        jumpCutRequested = false;
```

- **Play**: a tap of `Space` gives a short hop, a held `Space` the full 3.5 units. The `y > 0` check leaves the fall alone.
- `Ctrl` + `S`, then commit and push with the message `Cut the jump short on release`.
